VOLUME PHASE HOLOGRAPHIC TRANSMISSION GRATINGS

900 l/mm at 930 nm

These high-efficiency grating works well in the NIR spectrum region around 930 nm. They are created by using coherent laser light to write the interference pattern in dichromated gelatin. After processing, the grating is capped with a protective glass cover and then AR coated. The results are a grating with low scatter, high diffraction efficiency and low wavefront distortion. The grating is durable and can be cleaned using the same methods to clean AR coated optics. These gratings are available in 25.4 mm and 50.8 mm diameter sizes
